

1. Main menu

Start here, choose the job you need, and return to the Main menu whenever you change sections.

Local-first records

Calculator, Paddocks, Work Notes and 4830 Servicing keep working offline. Saved records remain on this device unless you deliberately download, restore or share a copy.

Navigation rule

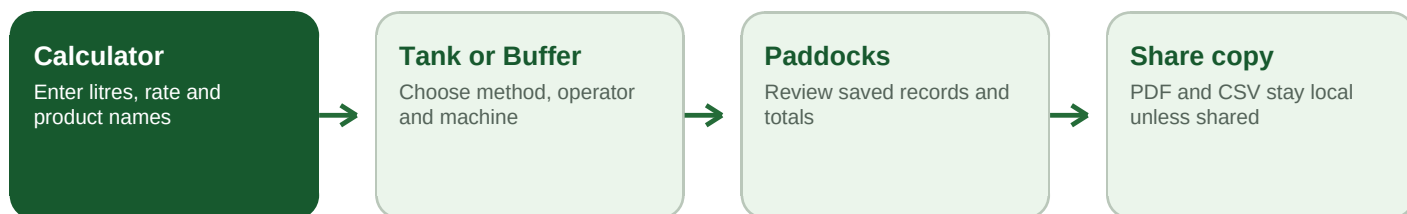

Use the Main menu button to leave a section. Complete or save the current form first if the app warns that work is still open. A new-version prompt waits for you to choose Update now.

Five clear destinations

Spray Operations handles mixing and spray records. Work Notes provides Week, Fortnight and Month views over the same daily notes. Weather Shortcuts opens trusted links. 4830 Servicing prepares workshop records. Settings holds Paddock Library and this guide.

2. Spray Operations

Build a mix, save an authoritative tank or Buffer record, then review the paddock before sharing a copy.

1. Calculate

Enter the required spray volume, spray rate and each product name and rate. Local calculations do not require operator or machine details.

2. Save the record

Choose Broadacre or Camera, confirm the paddock, then save the operator and machine snapshot with that tank. Buffers may be allocated across several paddocks.

3. Review coverage

Reported or calculated active-spray equivalent hectares are compared with the saved paddock total. Percentages may exceed 100 percent. They are calculated records, not GPS-measured unique ground.

4. Review products

Each product keeps its own mass or liquid unit. Chemical-equivalent hectares and signed variances are shown only when the saved amount, rate and spray-rate basis agree.

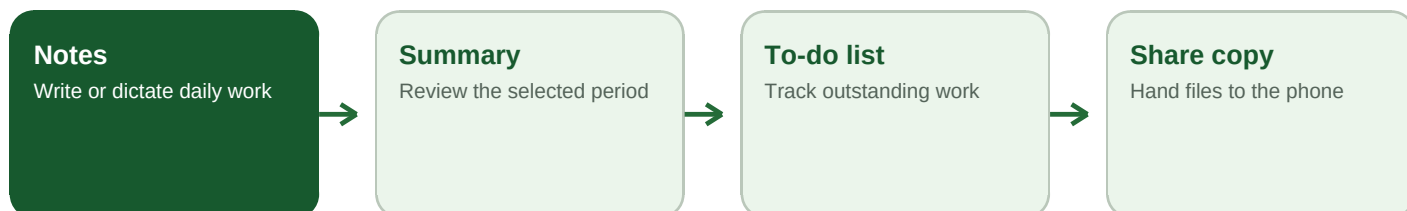

Share / Save Copy

Complete any missing legacy operator, machine or spray-method details first. The app then prepares PDF and CSV files offline. On a supported phone it hands those files to the share sheet; otherwise it downloads them. Sharing never deletes or moves the local Spray Record.

3. Work Notes and Weather Shortcuts

Review the same daily notes by Week, Fortnight or Month, then open trusted weather sources without adding a built-in forecast.

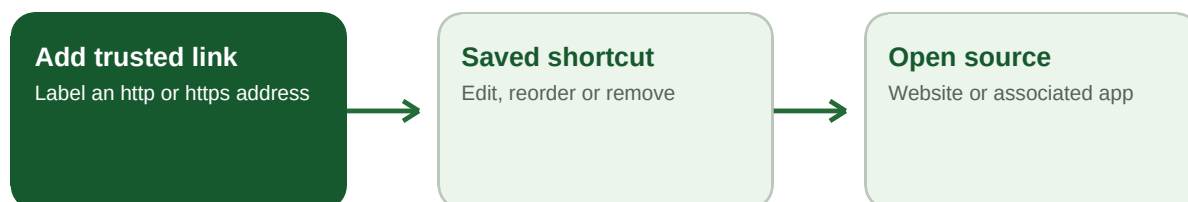

Work Notes

One diary, three views

Switch between Week, Fortnight and Month without duplicating or changing older notes. Autosave and previous-note recovery protect ordinary editing. Before sharing, inspect the preview; native share cancellation is quiet and a failed share falls back to a download copy.

Weather Shortcuts

Shortcut, not weather advice

The app does not claim that a station represents the paddock and does not give a safe-to-spray verdict. Use the saved source that suits the job and check its own time, location and attribution.

Device recovery

If a Work Notes or Weather settings save fails, use the visible retry or recovery-download controls before closing the app.

4. 4830 Servicing, Settings and backup

Complete workshop records carefully, maintain the Paddock Library, and keep device data recoverable.

4830 Servicing

Finalise deliberately

The checklist is a personal workshop record, not an official John Deere form or certified service. Deferred tasks stay separate, and required follow-on work remains visible in the To-do list.

Settings / Paddock Library

Add, edit or archive paddock names and total hectares. Archived paddocks remain in backups and historical Spray Records. The planned hectares for one spray job stay separate from the saved total.

Backup and restore

Open Work Notes, choose Data, then download the combined JSON backup. Restore only the intended file and read the confirmation because restore replaces the matching records on this device.

Download combined JSON

Keep a copy in your chosen folder

Restore after confirmation

Existing source keys are protected

Before clearing browser data

Download a current combined backup and any PDF, CSV or Work Notes copies you need. Clearing site data can remove device-local records. This App guide remains available offline after the current app update has finished caching.
