

1. Main menu

Start here, choose the job you need, and return to the Main menu whenever you change sections.

Local-first records

Calculator, Paddocks and manual Work Notes keep working offline. If 4830 Servicing is enabled, its local checklist and records work offline too. Saved records remain on this device unless you deliberately download, restore or share a copy.

Navigation rule

Use the Main menu button to leave a section. Complete or save the current form first if the app warns that work is still open. A new-version prompt waits for you to choose Update now.

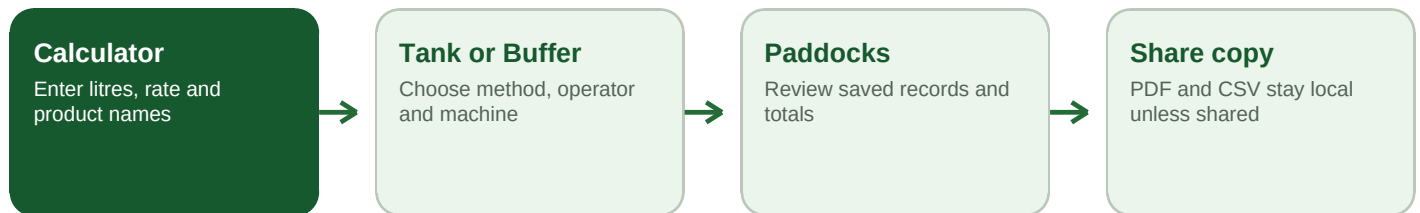

Five clear destinations

Spray Operations handles mixing and spray records. Work Notes provides Week, Fortnight and Month views over the same daily notes. Weather Shortcuts opens trusted links. Check the displayed availability state before using 4830 Servicing. Settings holds help, backup, property details, Paddock Library and downloaded-file guidance.

2. Spray Operations

Build a mix, save a tank or Buffer record, then review the paddock before sharing a copy.

1. Calculate

Enter Tank total, including all products, and the spray rate. Start with one product row and use Add product when needed, keeping each product name, rate and unit explicit. If an unfinished calculation is found after reopening, choose Resume calculation or Start fresh; a resumed edit becomes a new unsaved calculation and does not overwrite the original tank.

2. Save the record

Choose Save tank record, then complete the paddock, date, operator, machine and Broadacre or Camera review before choosing Save tank. After saving, choose View saved record or Prepare next tank. For several paddocks, choose Start buffer and Finish buffer when allocations are complete.

3. Review coverage

Reported or calculated active-spray equivalent hectares are compared with the saved paddock total. Percentages may exceed 100 percent. They are calculated records, not GPS-measured unique ground.

4. Review products

Each product keeps its own mass or liquid unit. For a Buffer, Controller remaining (L) means the reading left: from 2,000 L after using 500 L, enter 1,500 L. Review the allocation before recording each paddock.

Share / Save Copy

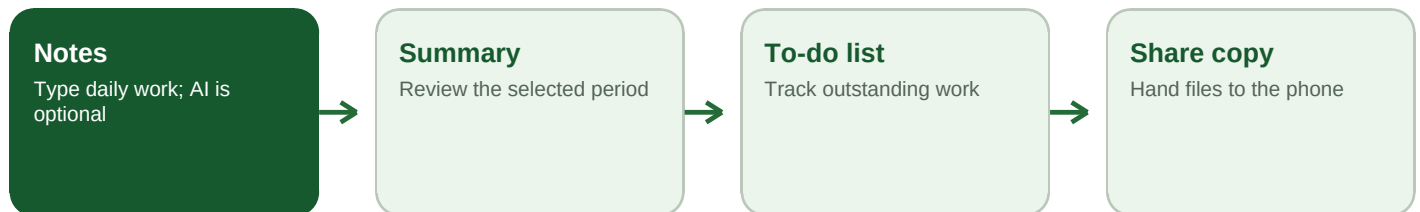

Use Find paddock to match part of a name and Clear to restore the recent-first list. PDF and CSV files are readable copies, not backups. Undo tank deletion can restore only the most recent deletion until another saved-record change or backup restore; clearing or archiving its paddock also prevents recovery, and a newer deletion replaces it.

3. Work Notes and Weather Shortcuts

Review the same daily notes by Week, Fortnight or Month, then open trusted weather sources without adding a built-in forecast.

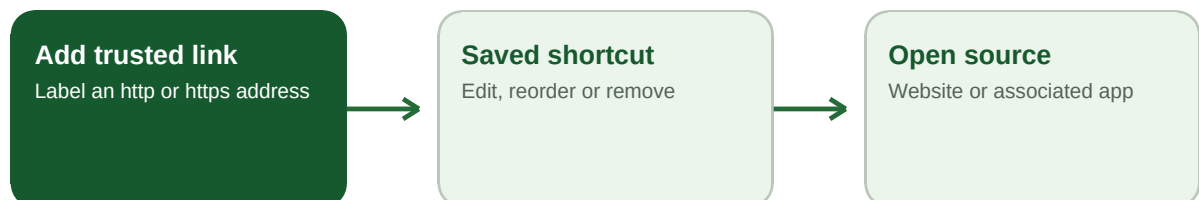

Work Notes

One diary, three views

Use the large Week, Fortnight and Month buttons and check the visible date range. Future blank dates say Upcoming but remain editable, and saved future notes remain visible. Type in What did you do?, check the saved indicator, then tap Done. Summary > Share / Save Copy prepares a readable copy. Manual notes work without AI; optional AI needs setup and internet, and AI summaries require Fortnight view.

Weather Shortcuts

Shortcut, not weather advice

The app does not claim that a station represents the paddock and does not give a safe-to-spray verdict. Use the saved source that suits the job and check its own time, location and attribution.

Device recovery

If a Work Notes or Weather settings save fails, use the visible retry or recovery-download controls before closing the app.

4. 4830 Servicing, Settings and backup

Complete workshop records carefully, maintain the Paddock Library, and keep device data recoverable.

4830 Servicing

Finalise deliberately

First check the displayed availability state. If it says Prepared, not active, record writing is unavailable. When enabled, the checklist is a personal workshop record, not an official John Deere form or certified service. Deferred tasks stay separate, and required follow-on work remains visible in the To-do list.

Property & appearance / Paddock Library

Set the farm name, optional short name, default reporting period and theme, then choose Save property settings. Add, edit or archive paddock names and total hectares. Planned job hectares stay separate from the saved paddock total.

Backup and restore

Open Settings > Backup and restore. If an action is unavailable, resolve the related section's unsaved change or download its recovery copy first. Back up all records creates a combined JSON file to keep separately. Restore all records lets you choose a file and inspect confirmation. PDF, CSV and text files are readable copies, not restorable backups.

Back up all records

Keep the JSON in a separate place

Restore all records

Choose a file and inspect confirmation

Before clearing browser data

Download a current combined backup and any PDF, CSV or Work Notes copies you need. Clearing site data can remove device-local records. This App guide remains available offline after the current app update has finished caching.
